

Criterion	Weight	<50	50–59	60–69	70–79	>80
Title & Abstract	3	Title or abstract missing or largely irrelevant.	Abstract partially describes the work but lacks clarity or key elements.	Abstract summarises the work but lacks precision or completeness.	Clear title and structured abstract summarising dataset, methods, and results.	Precise professional title and well-written abstract clearly presenting the research problem, methodology, key results, and contributions in an academic style comparable to an academic paper.
Introduction	5	Introduction missing or unclear. Research problem poorly defined.	Basic description of dataset or problem with weak motivation.	Dataset and research problem described with reasonable clarity.	Clear explanation of problem context and research objectives.	Excellent motivation and context. Research questions clearly defined and strongly justified with clear understanding of the problem domain.
Literature Review	5	Little or no relevant literature cited.	Minimal literature included with limited explanation.	Some relevant papers discussed but analysis limited.	Relevant literature clearly summarised and linked to the problem.	Critical synthesis of multiple relevant and recent studies, clearly explaining how the proposed work relates to existing methods.
Methodology	20	Methods inappropriate or unclear. Pipeline poorly described.	Basic modelling pipeline with limited justification.	Reasonable modelling pipeline implemented but explanation limited.	Appropriate modelling pipeline with good justification for preprocessing and modelling choices.	Rigorous and clearly justified methodology including preprocessing, feature engineering, model selection, and evaluation strategy. May include thoughtful improvements or enhancements beyond standard implementation.
Experimental Results & Analysis	20	Experiments missing, incorrect, or poorly executed.	Minimal experimentation with limited results.	Some experiments conducted but comparison or analysis limited.	Multiple models implemented and compared with clear presentation of results.	Well-designed experiments with strong evaluation and comparison of multiple approaches. Results clearly presented with appropriate figures, tables, and performance metrics.
Discussion	15	No meaningful interpretation of results.	Limited or superficial discussion of findings.	Basic interpretation of results with limited depth.	Clear discussion explaining model performance and results.	Deep critical analysis of findings, comparing models and interpreting results with strong analytical insight and connection to literature where relevant.
Conclusion & Future Work	10	Missing or irrelevant conclusion.	Weak or incomplete conclusion with little reflection.	Basic summary of findings.	Clear summary with discussion of limitations.	Strong summary of contributions, thoughtful discussion of limitations, and well-motivated suggestions for future research.
References	2	References missing or incorrect.	Poor referencing or inconsistent citation format.	Some relevant references but with formatting errors.	Appropriate references included with mostly correct citation style.	Relevant and reputable academic references used appropriately and consistently formatted using IEEE style.
Python Code Implementation	20	Code missing, fails to run, or cannot reproduce results.	Code partially works but difficult to follow or poorly documented.	Code runs but lacks structure or documentation.	Code clearly organised, reproducible, and mostly well documented.	Code is clean, modular, well-documented, and fully reproducible. Notebook demonstrates the complete data modelling workflow with good coding practices and clear explanations.
